

CRAFT SUPPLIES for CREATIVE PEOPLE

trendbolt.eu

Moulds are made of durable, stretchy silicone with excellent anti-stick effect. They can be used with various materials, including jesmonite, cement, epoxy resin, soap, wax.

Moulds are tested and proven to work with high-quality fine cement, jesmonite and resin. They are designed and tested to retain shape, however depending on your casting material some additional support might be needed. If you experience any irregularities, experiment with your mix and casting techniques. Final result depends on your mix, curing time, etc. and may differ from photos in the product listing.

Planters/cups demould easier with release agent (spray, liquid, wax). Most moulds turn inside out for easier demoulding. For products with thin walls recommended curing time is 24+ hours, depending on the mix you use.

Before using the mould rinse it with water and dry.

Moulds are intended for long-term use and suitable for hobby and small batch production, but not recommended for industrial scale use. Minor imperfections may occur due to handmade nature of the product.

Don't pull at one side.

After use clean your mould with water and soft sponge, don't use abrasive, aggressive products. Make sure to wash moulds between the mixes, or when using different color cement or pigments.

When used properly, moulds last many castings. Their life depends on your casting materials, usage and care.

Product price does not include post-sale consultations. You might need some time and more than one casting to get used to the mould and find your ideal mix and technique. Because cement/resin varies from country to country and from brand to brand the seller is not responsible for your casting results and can't offer any individual advices.
